

Assignment One:

① Identify & describe the Curves given by the Polar equations listed below:

a) $r = -5\cos\theta$

- this is a Polar equation representing a Circle.
- the distance from the origin is a magnitude of 5, w/ -5 being the furthest point from the origin along the x-axis.
- the Graph Starts at -5, as $-5\cos(0) = -5(1) = -5$

For more values, See below:

| θ | r | θ | r |
|------------------|------------------------|------------------|------------------------|
| 0 | -5 | $\frac{5\pi}{4}$ | $\frac{5\sqrt{2}}{2}$ |
| $\frac{\pi}{4}$ | $-\frac{5\sqrt{2}}{2}$ | $\frac{3\pi}{2}$ | 0 |
| $\frac{\pi}{2}$ | 0 | $\frac{7\pi}{4}$ | $-\frac{5\sqrt{2}}{2}$ |
| $\frac{3\pi}{4}$ | $\frac{5\sqrt{2}}{2}$ | 2π | -5 |
| π | -5 | | |

- As seen, at $\theta = 0$, $r = -5$; thus placing it 5 units to the reflection of angle $\theta = 0$ (aka -5, on the x-axis)
- the graph then rotates Counter-clockwise to zero on the x-axis, then from there back to -5 on the x-axis as θ approaches π .

→ one Period occurs in π radians, thus:

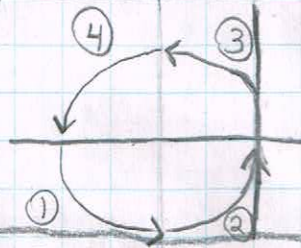

$-5\cos(0) = -5\cos(\pi) = -5$ (on x-axis)

to Show this:

$-5\cos(0) = -5$

$-5\cos(\pi) = -(-5) = 5$

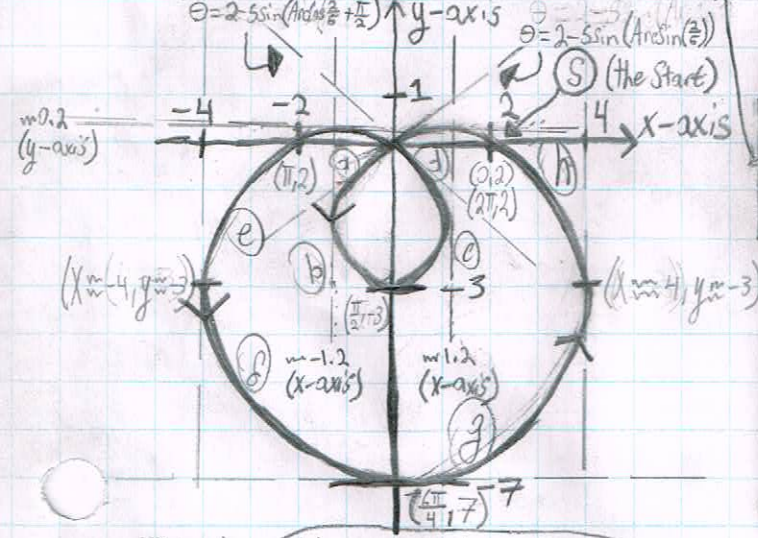

the graph forms in the following order:

1. $0 \leq \theta \leq \frac{\pi}{4}$
2. $\frac{\pi}{4} \leq \theta \leq \frac{\pi}{2}$
3. $\frac{\pi}{2} \leq \theta \leq \frac{3\pi}{4}$
4. $\frac{3\pi}{4} \leq \theta \leq \pi$

$\frac{2}{5} < 1$ ∴ Limaçon w/ inner loop

b) $r = 2 - 5\sin\theta$

Reflected Angle (θ)
Positions ($r < 0$)

Table of values:

| r | θ |
|------------------|-------------------------|
| 0 | 2 |
| $\frac{\pi}{4}$ | $\frac{4-5\sqrt{2}}{2}$ |
| $\frac{\pi}{2}$ | -3 |
| $\frac{3\pi}{4}$ | $\frac{4-5\sqrt{2}}{2}$ |
| π | 2 |
| $\frac{5\pi}{4}$ | $\frac{4+5\sqrt{2}}{2}$ |
| $\frac{6\pi}{4}$ | 7 |
| $\frac{7\pi}{4}$ | $\frac{4+5\sqrt{2}}{2}$ |
| 2π | 2 |

marks indicate Polar region on Graph

- $r = 0$ when $0 = 2 - 5\sin\theta$ thus: $2 - 5\sin(\text{ArcSin}(\frac{2}{5})) = 0$
- thus: $\theta = \text{ArcSin}(\frac{2}{5}) \approx 0.4115$
- thus: $2 - 5\sin(\text{ArcCos}(\frac{2}{5}) + \frac{\pi}{2}) = 0$
- $\sin\theta = \frac{2}{5} \Rightarrow \theta = \text{ArcSin}(\frac{2}{5})$
- $\cos(\theta - \frac{\pi}{2}) = \frac{2}{5}$
- $\theta = \text{ArcCos}(\frac{2}{5}) + \frac{\pi}{2} \approx 2.73$

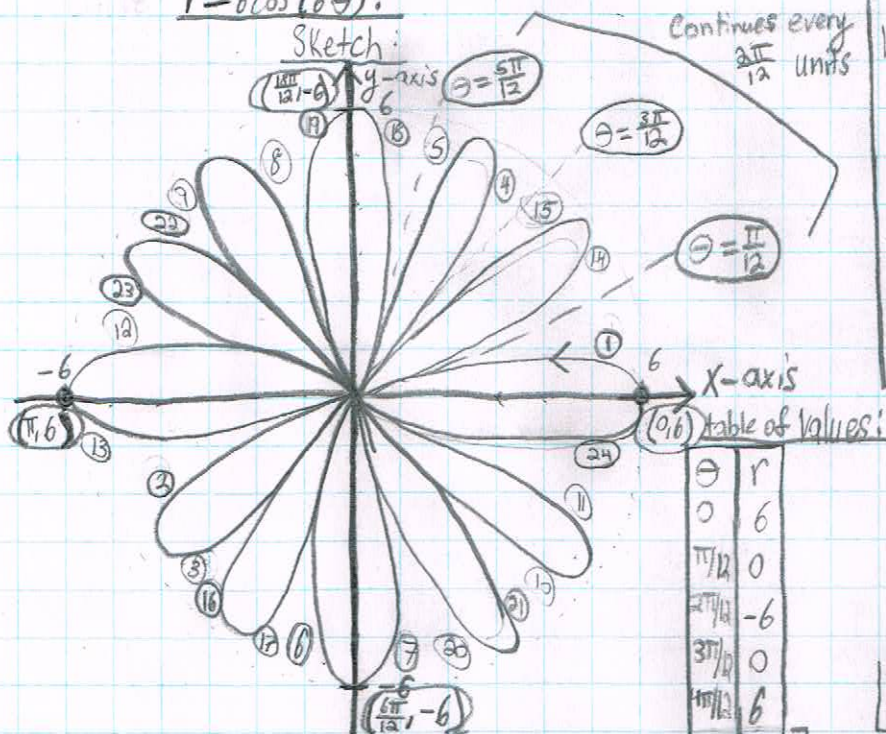

- the period is 2π

- This is a Limaçon w/ inner loop
- the rotation is Counter-clockwise

c) $r = 6\cos(6\theta)$

$r = 6\cos(6\theta)$

Sketch:

12-Petal Rose

When $6\cos(6\theta) = 0$:

$\theta = \frac{\arccos(0)}{6}$

$\theta = \pi/12$

When $\theta = 3\pi/12$, $6\cos(6\theta) = 0$

∴ Each Petal occupies $2\pi/12$ of the graph.

the Petals are Spaced evenly every $2\pi/12$ radians, thus there are 12 Petals as 2π divided by $2\pi/12$ equals 12. When θ is multiplied by even numbers, the Petals don't overlap, meaning all 12 Petals appear on the graph as θ changes from 0 to 2π .

The order that the leaves appear when θ shifts from 0 to 2π are marked as ① to ②4 on the graph

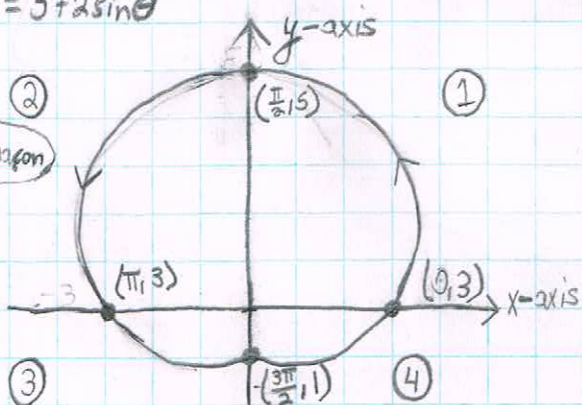

Table of values:

| θ | r |
|-----------|-----|
| 0 | 6 |
| $\pi/12$ | 0 |
| $2\pi/12$ | -6 |
| $3\pi/12$ | 0 |
| $4\pi/12$ | 6 |
| ... | ... |
| 2π | 6 |

Continue Pattern...

d) $r = 3 + 2\sin\theta$

$1 < \frac{3}{2} < 2$
∴ Dimpled Limacon

When $\theta = 0$:

$r = 3 + 2\sin(0)$

$r = 3$

When $\theta = \pi$:

$r = 3 + 2\sin(\pi)$

$r = 3$

When $\theta = 2\pi$:

$r = 3 + 2\sin(2\pi)$

$r = 3$

When $\theta = \frac{3\pi}{2}$:

$r = 3 + 2\sin(\frac{3\pi}{2})$

$r = 3 - 2$

$r = 1$

When $\theta = \pi$:

$r = 3 + 2\sin(\pi)$

$r = 3$

When $\theta = \pi/2$:

$r = 3 + 2\sin(\pi/2)$

$r = 5$

As θ increases, the graph

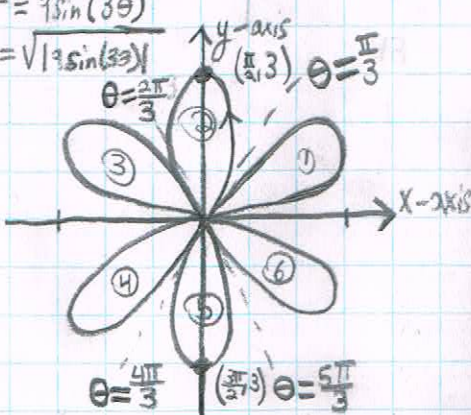

Progresses from ① to ④

①: 0 to $\frac{\pi}{2}$ ③: π to $\frac{3\pi}{2}$

②: $\frac{\pi}{2}$ to π ④: $\frac{3\pi}{2}$ to 2π

e) $r^2 = 9\sin(3\theta)$

$r = \sqrt{9\sin(3\theta)}$

∴ 6-Petal Rose

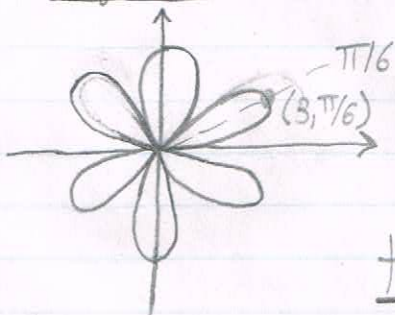

| θ | r |
|----------|-----|
| 0 | 0 |
| $\pi/6$ | 3 |
| $2\pi/3$ | 0 |
| $\pi/3$ | 0 |
| $\pi/2$ | 3 |
| $5\pi/3$ | 3 |
| π | 0 |
| ... | ... |
| 2π | 0 |

the leaves appear every $\frac{\pi}{3}$ radians in the order listed in the graph. The leaves appear from ① to ⑥ as the value θ changes from 0 to 2π

Same Pattern for π to 2π

2) Give the Slope of the tangent line to the Polar Curve $r^2 = 9\sin(3\theta)$ at the point $(3, \frac{\pi}{6})$:

Rough Sketch:

When $\theta = \pi/6$:

$r = 3$ & r of 3 is max.

$$\begin{aligned} y &= r \sin \theta & \therefore \frac{dy}{d\theta} &= r \cos \theta + \sin \theta \frac{dr}{d\theta} \\ x &= r \cos \theta & \therefore \frac{dx}{d\theta} &= -r \sin \theta + \cos \theta \frac{dr}{d\theta} \end{aligned}$$

$$\text{thus: } \frac{dy}{dx} = \frac{dy/d\theta}{dx/d\theta} = \frac{r \cos \theta + \sin \theta \frac{dr}{d\theta}}{-r \sin \theta + \cos \theta \frac{dr}{d\theta}}$$

find rectangular coordinates: ($\theta = \pi/6$ & $r = 3$)

$$x = 3 \cos(\pi/6) = \frac{3\sqrt{3}}{2}$$

$$y = 3 \sin(\pi/6) = \frac{3}{2}$$

Next, we find the Slope of the tangent line, \therefore we must find the derivative at the point:

$$m = \frac{dy}{dx} \text{ when } t = \frac{\pi}{6}$$

We must also derive r :

$$\begin{aligned} \frac{dr}{d\theta} &= \left(\sqrt{9\sin(3\theta)} \right)' = 3 \cdot \frac{1}{2} |\sin(3\theta)|^{-1/2} \cdot 3\sin(3\theta)\cos(3\theta) \\ &= \frac{9 \left(\frac{\sin(3\theta)}{|\sin(3\theta)|} \right) \cos(3\theta)}{2 |\sin(3\theta)|^{1/2}} = \frac{9 \sin(3\theta) \cos(3\theta)}{2 |\sin(3\theta)|^{3/2}} \end{aligned}$$

Or, simply $\Rightarrow \frac{9 \cos(3\theta)}{2 \sqrt{\sin(3\theta)}}$, Such that $9 \sin(3\theta) \geq 0$

$$\text{thus: } \frac{dy}{dx} = \frac{r \cos \theta + \sin \theta r'}{-r \sin \theta + \cos \theta r'} = \frac{(\sqrt{9\sin(3\theta)}) \cos \theta + \sin \theta \left(\frac{9 \cos(3\theta)}{2 \sqrt{\sin(3\theta)}} \right)}{\left(\frac{9 \cos(3\theta)}{2 \sqrt{\sin(3\theta)}} \right) \sin \theta - (\sqrt{9\sin(3\theta)}) \sin \theta}$$

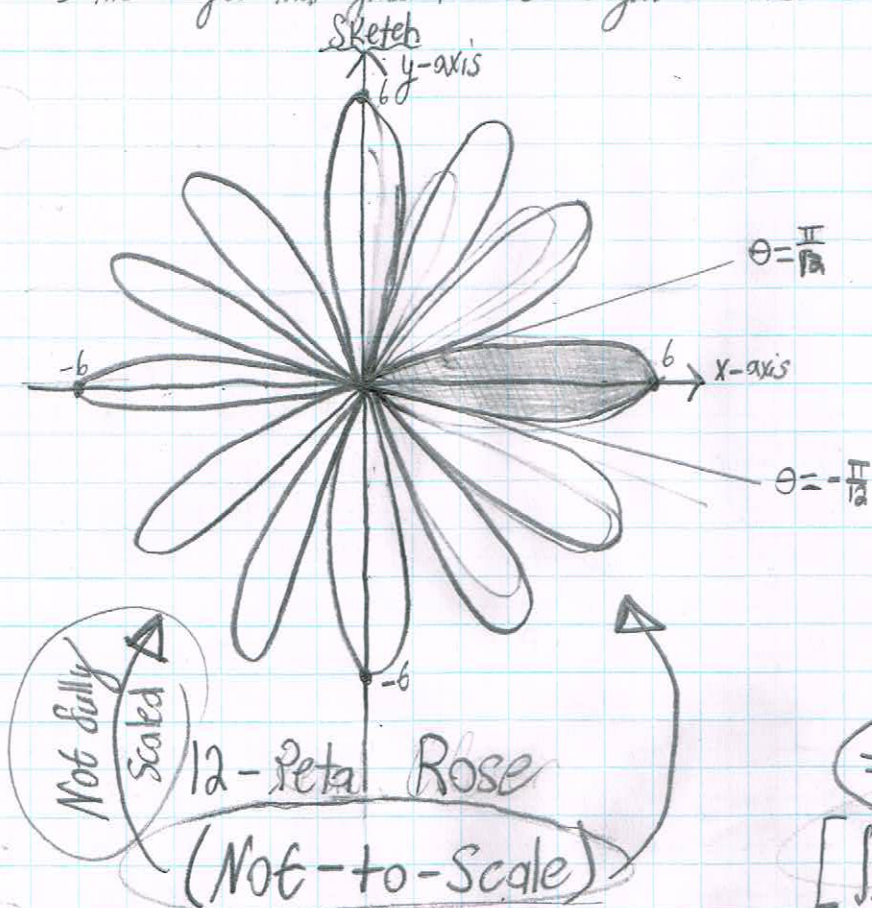

Let $t = \pi/6$:

$$m = \frac{(\sqrt{9\sin(\pi/2)}) \cos \pi/6 + \sin \pi/6 \left(\frac{9 \cos(\pi/2)}{2 \sqrt{\sin(\pi/2)}} \right)}{\left(\frac{9 \cos(\pi/2)}{2 \sqrt{\sin(\pi/2)}} \right) \sin \pi/6 - (\sqrt{9\sin(\pi/2)}) \sin \pi/6} = \frac{3\sqrt{3}/2}{-3/2} = \frac{\sqrt{3}}{2} \cdot -\frac{2}{3} = -\sqrt{3}$$

$$\boxed{m = -\sqrt{3}}$$

\therefore the Slope of the tangent line is $-\sqrt{3}$.

3) the integral that gives the arc length of one of the leaves of the polar curve $r = 6\cos(6\theta)$

$$\alpha = \pi/12, \beta = -\pi/12, r = 6\cos(6\theta)$$

$$\int_{\alpha}^{\beta} \frac{1}{2} r^2 d\theta$$

$$= \int_{-\pi/12}^{\pi/12} \frac{1}{2} (6\cos(6\theta))^2 d\theta$$

$$= \cancel{\left(\frac{1}{2}\right)} \int_0^{\pi/12} 36 \cos^2(6\theta) d\theta$$

↳ we convert α to 0 &

multiply by two since the
integral of 0 to $\frac{\pi}{12}$ is exactly
half the area; thus the results

are equivalent

$$= 36 \int_0^{\pi/12} \cos^2(6\theta) d\theta$$

$$\left[\int_{-\pi/12}^{\pi/12} \frac{1}{2} (6\cos(6\theta))^2 d\theta \text{ unsimplified} \right]$$

4) Find the area of the inner loop of the Cardioid: $r = 1 - \sqrt{2} \sin \theta$

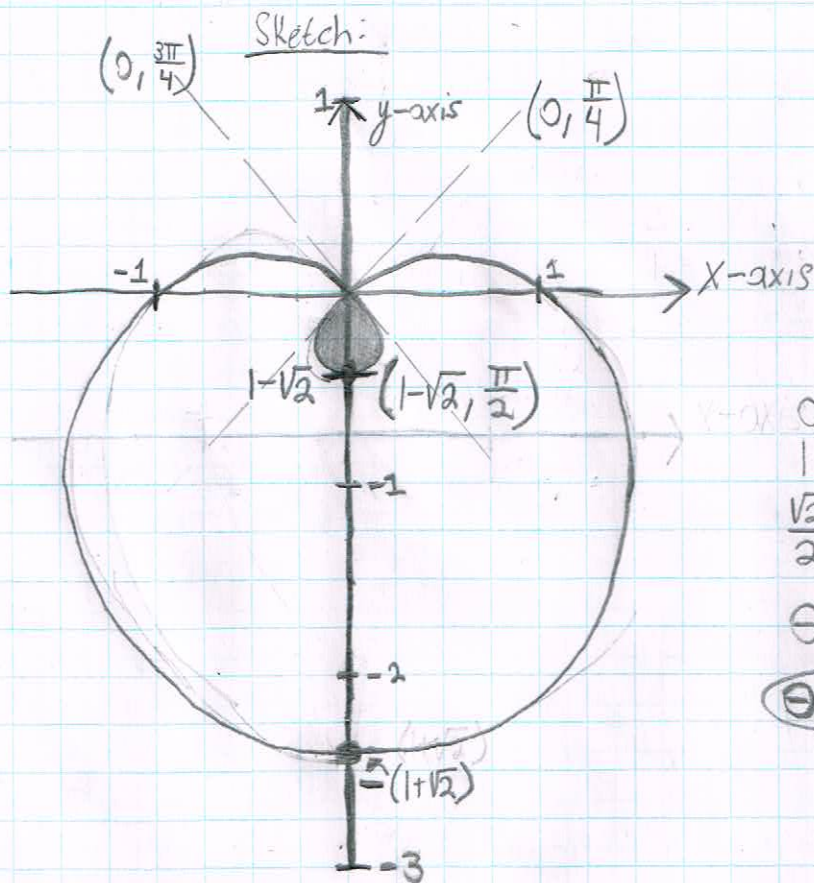

table of values:

| θ | r |
|----------|----------------|
| 0 | 1 |
| $\pi/2$ | $1 - \sqrt{2}$ |
| π | 1 |
| $3\pi/2$ | $1 + \sqrt{2}$ |
| 2π | 1 |

$$0 = 1 - \sqrt{2} \sin \theta$$

$$1 = \sqrt{2} \sin \theta$$

$$\frac{\sqrt{2}}{2} = \sin \theta$$

$$\theta = \text{ArcSin}\left(\frac{\sqrt{2}}{2}\right)$$

$$\theta = \pi/4 \text{ OR } \theta = 3\pi/4$$

to find the Area, we take the integration of θ from $\pi/4$ to $3\pi/4$ via the following:

$$A = \int_{\alpha}^{\beta} \frac{1}{2} r^2 d\theta \text{ where } r = 1 - \sqrt{2} \sin \theta, \beta = \frac{3\pi}{4}, \text{ \& } \alpha = \frac{\pi}{4}$$

thus: plug in the values

$$A = \int_{\pi/4}^{3\pi/4} \left(\frac{1}{2}\right) (1 - \sqrt{2} \sin \theta)^2 d\theta$$

We know that the inner loop of the Cardioid (or in this case a limaçon) is symmetrical, thus the area of 2 times the integral over half the range θ is the same as the above equation.

$\frac{\beta - \alpha}{2} = \frac{\pi}{4}$
 $\alpha + \frac{\pi}{4} = \frac{\pi}{2}$
 \therefore the new $\beta = \pi/2$

$\therefore A = 2 \int_{\pi/4}^{\pi/2} \frac{1}{2} (1 - \sqrt{2} \sin \theta)^2 d\theta$

thus:

the area of the inner loop of the Cardioid is

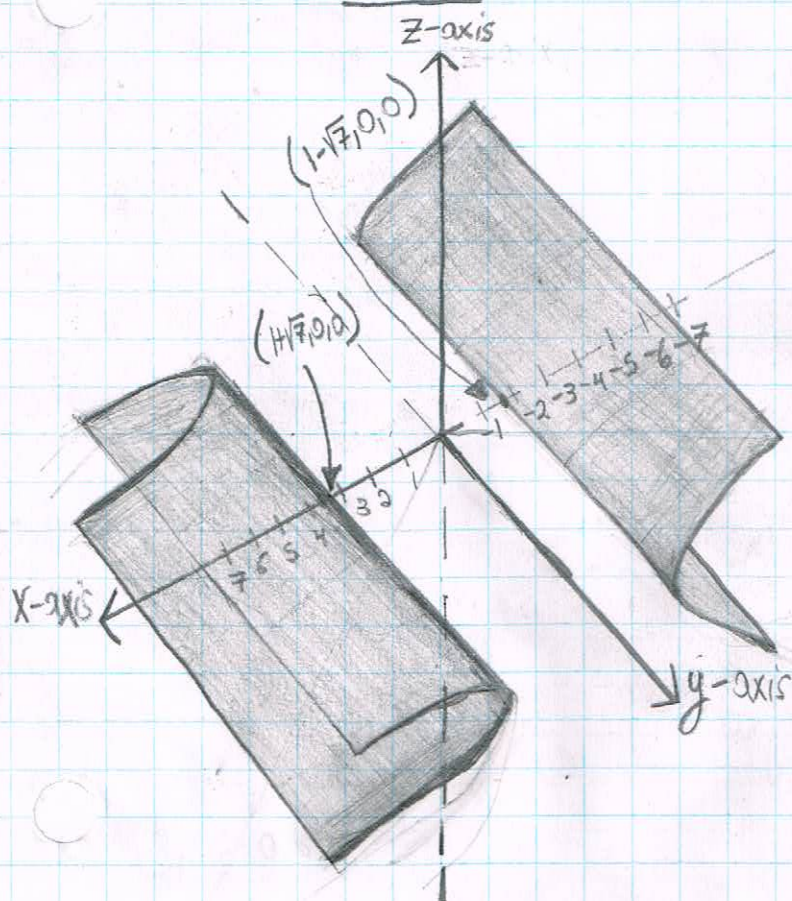

$$A = \frac{\pi - 3}{2} \text{ (or, approx. 20.07\%)}$$

$$\begin{aligned} &= \int_{\pi/4}^{\pi/2} (1 - \sqrt{2} \sin \theta)^2 d\theta = \int_{\pi/4}^{\pi/2} (1 - 2\sqrt{2} \sin \theta + 2 \sin^2 \theta) d\theta \\ &= \int_{\pi/4}^{\pi/2} (1 - 2\sqrt{2} \sin \theta + 2 \sin^2 \theta) d\theta = \left[\theta + 2\sqrt{2} \cos \theta + \frac{1}{2} \sin 2\theta \right]_{\pi/4}^{\pi/2} \\ &= \left[\theta + 2\sqrt{2} \cos \theta + \frac{1}{2} \sin 2\theta \right]_{\pi/4}^{\pi/2} = \left(\frac{\pi}{2} + 2\sqrt{2} \cos \left(\frac{\pi}{2} \right) + \frac{1}{2} \sin(\pi) \right) - \left(\frac{\pi}{4} + 2\sqrt{2} \cos \left(\frac{\pi}{4} \right) + \frac{1}{2} \sin \left(\frac{\pi}{2} \right) \right) \\ &= \left(\frac{\pi}{2} - 2\sqrt{2} \right) - \left(\frac{\pi}{4} + 2\sqrt{2} \cdot \frac{1}{\sqrt{2}} + \frac{1}{2} \right) = \frac{\pi}{4} - 3 = \frac{\pi - 12}{4} \end{aligned}$$

5) Provide a sketch & description of the surfaces in three dimensions listed below:

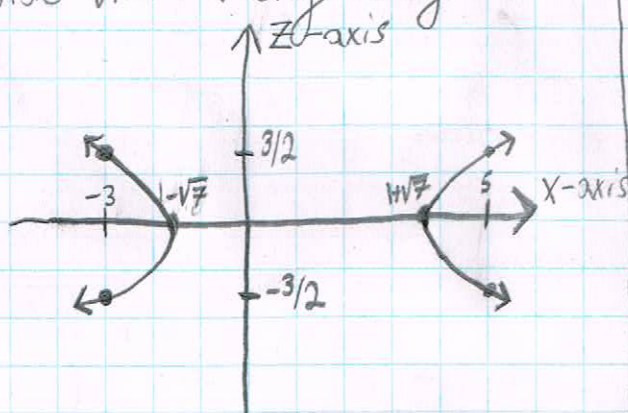

a) $x^2 - 2x - 4z^2 = 6$

Sketch:

Shape: Hyperbolic Cylinder

Side view: facing the y-axis

Note: this equation may also be interpreted as: $x^2 - 2x - 4y^2 = 6$ on a 2D graph (when the 3D version is "viewed down" the y-axis).

X-intercept:

When $z=0$: $[x^2 - 2x - 4(0)^2 = 6]$

$x^2 - 2x = 6$

$x^2 - 2x - 6 = 0$

$\rightarrow \frac{-(-2) \pm \sqrt{(-2)^2 - 4(1)(-6)}}{2} = \frac{2 \pm \sqrt{28}}{2}$

$= \frac{2 \pm 2\sqrt{7}}{2} = \boxed{1 \pm \sqrt{7}}$

thus $x = 1 - \sqrt{7}$ OR $x = 1 + \sqrt{7}$ at the X-intercept

Z-intercept:

When $x=0$: $[0^2 - 2(0) - 4z^2 = 6]$

$-4z^2 = 6$

$z^2 = 6/-4$

$z = \sqrt{-3/2}$

$z = \frac{\sqrt{6}}{2}i$

$z = \frac{\sqrt{6}}{2}i$

thus, z is imaginary \therefore there's no Z-axis intercept

y-axis:

-The y-axis is not in the equation & is therefore free. Thus $y \in \mathbb{R}$.

Shape:

-the equation is of the form:

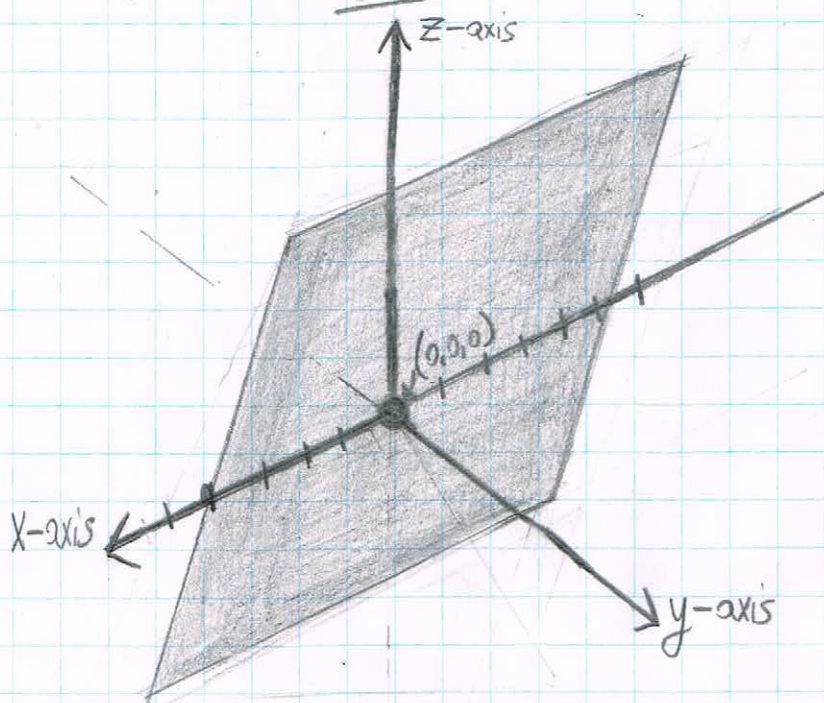

$\frac{(x-1)^2}{a} - \frac{1}{a} + \frac{z^2}{b} = 0$, thus the shape

is a hyperbolic cylinder which exists in the x & z axis & is free along the y-axis.

-This Can be Seen in the Sketch

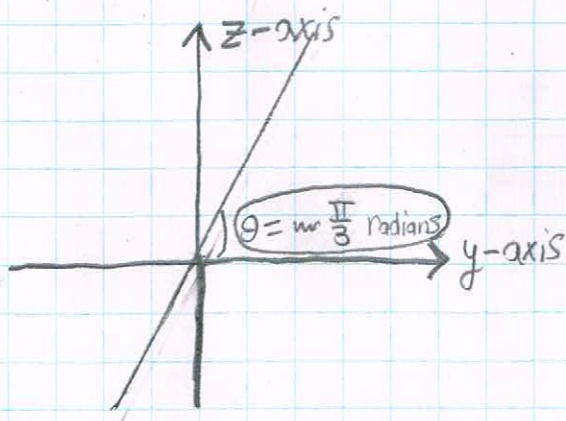

b) $2y - z = 0$

Sketch:

Shape: Tilted Plain

(Side view: Facing the x-axis)

Note:

this line can be seen as: $2x = y$ on a 2D graph (i.e. When the 3D version is viewed down the y-axis).

z-intercept:

When $y = 0$:
 $z = 0$

y-intercept:

When $z = 0$:
 $y = 0$

x-axis:

x is not in equation, thus $x \in \mathbb{R}$

Shape:

- The equation is of the form:

$$\frac{2y}{a} - \frac{z}{a} = 0, \text{ thus the shape}$$

is a tilted Plain which travels through the y & z dimensions, & is free along the x dimension.

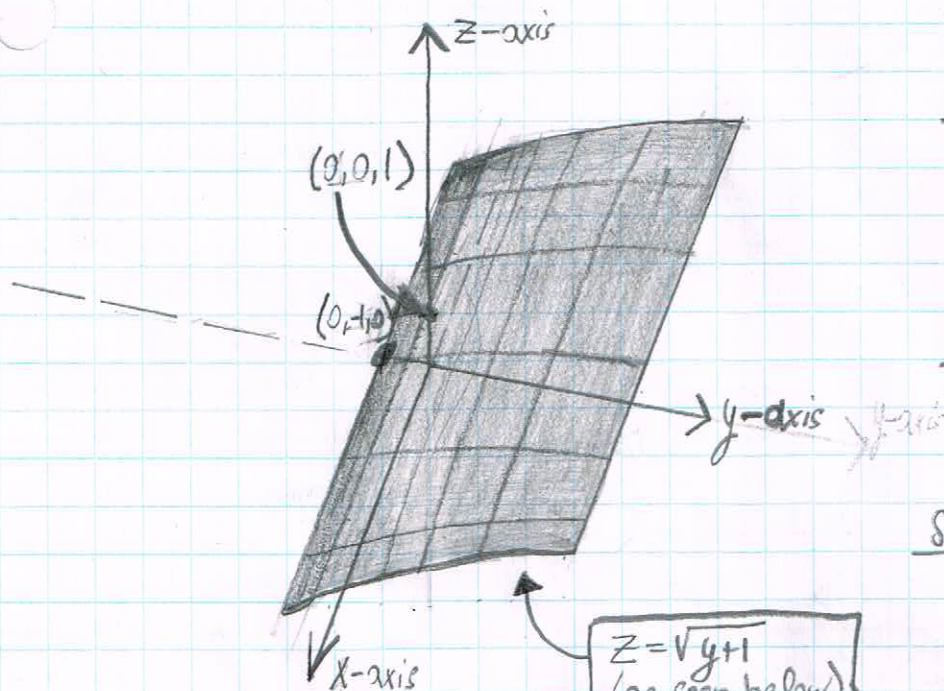

- thus, the Plain can be seen as infinitely many lines parallel along x-axis traveling through the z & y axes.

- The Plain is tilted towards the z-axis, which is hard to see in the main sketch.

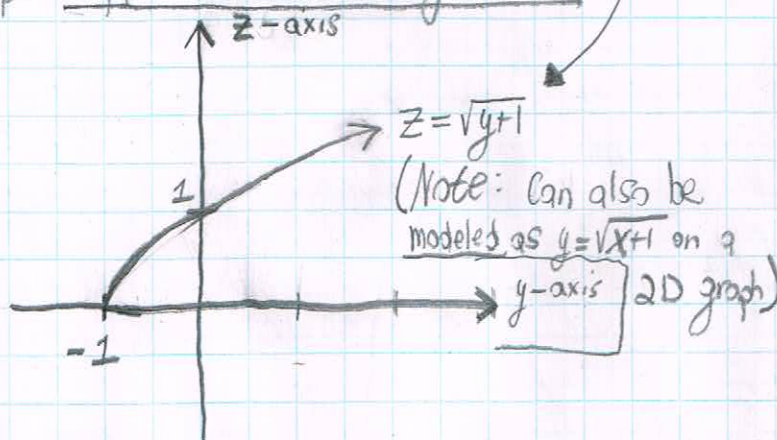

• The Plain itself is tilted $\approx \frac{1}{3}$ towards the z-axis & $\approx \frac{2}{3}$ towards the y-axis!

c) $z = \sqrt{y+1}$ thus $z^2 = y+1, y+1 \geq 0$

Sketch:

Shape: Upper Parabolic Cylinder

Side View: Facing down the x -axis

z -intercept:

When $y=0$:

$$z = \sqrt{1}$$

$$\therefore z = 1$$

y -intercept:

When $z=0$:

$$0 = \sqrt{y+1}$$

$$0^2 = y+1$$

$$\therefore y = -1$$

x -axis:

x is not included in the equation $\therefore x \in \mathbb{R}$ for any value of z or y within the equations.

Shape:

- this equation is of the form:

$$z^2 - y = 1 \text{ where } y+1 \geq 0$$

- thus:

The equation results in a Parabolic Cylinder forming through the z & y axis, & traveling along the x -axis.

□ the Par. cyl.'s hyperbolic curve forms along the z & y axis.

□ the curve stretches forever along the x -axis.

• The restriction that $y+1 \geq 0$ results the Parabolic Cylinder only having its upper segment.

- Therefore,

the shape is an upper Parabolic Cylinder. This is reflected in the sketch.

6) $a = \langle -2, 4, 1 \rangle$, $b = \langle 2, -3, 0 \rangle$, & $c = \langle 3, -4, 2 \rangle$

a) The angle between the vectors b & c :

First use the dot product to find:

$$b \cdot c = 2(3) + (-3)(-4) + \cancel{0(2)} = 6 + 12 = 18$$

Now find the norm of b & c :

$$\|b\| = \sqrt{2^2 + (-3)^2 + 0^2} = \sqrt{13}$$

$$\|c\| = \sqrt{3^2 + (-4)^2 + 2^2} = \sqrt{29}$$

Now find the ArcCos of the angle:

$$\frac{b \cdot c}{\|b\|\|c\|} = \frac{18}{\sqrt{13}\sqrt{29}} = \frac{18}{\sqrt{377}}$$

Use the inverse Cos to find theta:

$$\theta = \text{ArcCos}\left(\frac{b \cdot c}{\|b\|\|c\|}\right) = \text{ArcCos}\left(\frac{18}{\sqrt{377}}\right) \doteq 22.02^\circ$$

$$\text{thus: } \theta \doteq 22.02^\circ \text{ [or, } \theta \doteq 0.384337 \text{ radians]}$$

b) $\text{Proj}_b a = \frac{a \cdot b}{\|b\|^2} b$

$$= \frac{\langle -2, 4, 1 \rangle \cdot \langle 2, -3, 0 \rangle}{\|\langle 2, -3, 0 \rangle\|^2} \langle 2, -3, 0 \rangle$$

$$= \frac{(-2)(2) + (4)(-3) + \cancel{(1)(0)}}{(\sqrt{2^2 + (-3)^2 + 0^2})^2} \langle 2, -3, 0 \rangle$$

$$= \frac{-4 + (-12)}{\sqrt{13}^2} \langle 2, -3, 0 \rangle$$

$$= -\frac{16}{13} \langle 2, -3, 0 \rangle$$

$$= \left\langle -\frac{32}{13}, \frac{48}{13}, 0 \right\rangle$$

thus:

$$\text{Proj}_b a = -\frac{16}{13} \langle 2, -3, 0 \rangle = \left\langle -\frac{32}{13}, \frac{48}{13}, 0 \right\rangle$$

$$c) (a \cdot b)(c - b)$$

$$= (\langle -2, 4, 1 \rangle \cdot \langle 2, -3, 0 \rangle) (\langle 3, -4, 2 \rangle - \langle 2, -3, 0 \rangle)$$

$$= (-2(2) + 4(-3) + 1(0)) (\langle 3-2, -4-(-3), 2-0 \rangle)$$

$$= (-4-12) \langle 1, -1, 2 \rangle$$

$$= -16 \langle 1, -1, 2 \rangle$$

$$= \langle -16, 16, -32 \rangle$$

thus:

$$(a \cdot b)(c - b) = -16 \langle 1, -1, 2 \rangle = \langle -16, 16, -32 \rangle$$

$$d) (a - b) \times (b - c)$$

$$= (\langle -2, 4, 1 \rangle - \langle 2, -3, 0 \rangle) \times (\langle 2, -3, 0 \rangle - \langle 3, -4, 2 \rangle)$$

$$= \langle -2-2, 4-(-3), 1-0 \rangle \times \langle 2-3, -3-(-4), 0-2 \rangle$$

$$= \langle -4, 7, 1 \rangle \times \langle -1, 1, -2 \rangle$$

$$\begin{array}{c} \begin{array}{c} \downarrow \\ \begin{array}{|c|c|c|c|} \hline i & j & k & \\ \hline -4 & 7 & 1 & \\ \hline -1 & 1 & -2 & \\ \hline \end{array} \\ \downarrow \end{array} \end{array} \quad \begin{array}{l} = -14i - 8j - 4k + 7k - i - 8j \\ = -15i - 9j + 3k \end{array}$$

$$\boxed{= \langle -15, -9, 3 \rangle}$$

7) Consider the Parallelepiped w/ the following edges:

$$u = \langle 3, -2, 5 \rangle, v = \langle 2, 1, 2 \rangle, w = \langle 2, 5, 5 \rangle$$

a) Find the volume of the Parallelepiped: (Use a Scalar triple Product)

$$V = |u \cdot (v \times w)|$$

$$V = |\langle 3, -2, 5 \rangle \cdot (\langle 2, 1, 2 \rangle \times \langle 2, 5, 5 \rangle)|$$

$v \times w$:

$$\begin{vmatrix} i & j & k \\ 2 & 1 & 2 \\ 2 & 5 & 5 \end{vmatrix} = 8i + 4j + 10k - 2k - 10i - 10j = -5i - 6j + 8k$$

thus: $v \times w = \langle -5, -6, 8 \rangle$

$$V = |\langle 3, -2, 5 \rangle \cdot \langle -5, -6, 8 \rangle|$$

$$V = |3(-5) + (-2)(-6) + 5(8)|$$

$$V = |-15 + 12 + 40|$$

$$V = |37|$$

$$V = 37$$

∴ the volume of the Parallelepiped is 37

b) Find the area of the face determined by the vectors u and w :

$$A = \|u \times w\| = \|\langle 3, -2, 5 \rangle \times \langle 2, 5, 5 \rangle\|$$

$u \times w$:

$$\begin{vmatrix} i & j & k \\ 3 & -2 & 5 \\ 2 & 5 & 5 \end{vmatrix} = -10i + 10j + 15k + 4k - 25i - 15j = -35i - 5j + 19k = \langle -35, -5, 19 \rangle$$

thus: $u \times w = \langle -35, -5, 19 \rangle$

$$A = \|\langle -35, -5, 19 \rangle\|$$

$$A = \sqrt{(-35)^2 + (-5)^2 + 19^2} = \sqrt{1611} = \sqrt{9 \cdot 179} = 3\sqrt{179}$$

∴ the area of the face determined by the vectors u and w is $3\sqrt{179}$
[or, simply $\sqrt{1611}$ which is ≈ 40.137]

c) Find the angle between u & the face determined by the vectors v and w .
Find the plane perpendicular to the one determined by v & w :

$$v \times w; \langle 2, 1, 2 \rangle \times \langle 2, 5, 5 \rangle:$$

$$\begin{vmatrix} i & j & k \\ 2 & 1 & 2 \\ 2 & 5 & 5 \end{vmatrix} = 5i + 4j + 6k - 2k - 10i - 10j = -5i - 6j + 8k = \langle -5, -6, 8 \rangle$$

We can now find the angle (θ) between u & $v \times w$:

$$\cos \theta = \frac{u \cdot (v \times w)}{\|u\| \|v \times w\|} = \frac{\langle 3, -2, 5 \rangle \cdot \langle -5, -6, 8 \rangle}{\|\langle 3, -2, 5 \rangle\| \|\langle -5, -6, 8 \rangle\|}$$

$$\cos \theta = \frac{(3)(-5) + (-2)(-6) + (5)(8)}{\sqrt{3^2 + (-2)^2 + 5^2} \sqrt{(-5)^2 + (-6)^2 + 8^2}}$$

$$\cos \theta = \frac{-15 + 12 + 40}{\sqrt{38} \sqrt{125}} = \frac{37}{5\sqrt{5}\sqrt{38}} = \frac{37}{5\sqrt{190}}$$

$$\text{Arccos}(\cos \theta) = \text{Arccos}\left(\frac{37}{5\sqrt{190}}\right)$$

$$\theta \doteq 57.53^\circ \text{ [or, } \theta \doteq 1.004 \text{ radians]}$$

\therefore the angle between u & the face determined by v & w is 57.53°
[or simply 1.004 radians]

8) Give the Parametric equations of the line that passes through the point $P(1, -2, -3)$ & is parallel to the vector $\langle 0, -1, 5 \rangle$.

$$r = \langle 1, -2, -3 \rangle \text{ \& \> } v = \langle 0, -1, 5 \rangle$$

vector equation:

$$r = \langle 1, -2, -3 \rangle + t \langle 0, -1, 5 \rangle$$

thus, the Parametric equations of the line are:

$$\begin{aligned} x &= 1 \\ y &= -2 - t \\ z &= -3 + 5t \end{aligned}$$

Determine if the points listed below are on this line:

a) $Q(1, -2, -1)$:

① $x=1$ & $x=1$ thus $1=1 \therefore t \in \mathbb{R}$ (t is any Real number)

② $y=-2-t$ & $y=-2$ thus $-2=-2-t \therefore t=0$

③ $z=-3+5t$ & $z=-1$ thus $-1=-3+5t$

$$0 = -2 + 5t$$

$$2 = 5t$$

$$t = \frac{2}{5}$$

In ②, we see that t must equal 0, but in ③ we see t must equal $\frac{2}{5}$, thus it is contradictory to have the point $(1, -2, -1)$ as t can only have one unique value.

$\therefore Q$ is NOT on the line

b) $W(1, 5, -38)$:

① $x=1$ & $x=1$ thus $1=1 \therefore t \in \mathbb{R}$ (t is any real number)

② $y=-2-t$ & $y=5$ thus $5=-2-t \therefore t=-7$

③ $z=-3+5t$ & $z=-38$ thus $-38=-3+5t \therefore t=-7$

Since both ② & ③ have that $t=-7$, & since ① states t may be any real number (& since -7 is a real number), the point $(1, 5, -38)$ is on the line.

$\therefore W$ IS on the line

1) Give the equation of the plane that contains the line $x=3t, y=1-2t, z=1-t$ & is perpendicular to the plane $x-y+3z=3$:

$V = \langle 3, -2, -1 \rangle$ is parallel to the line

$n = \langle 1, -1, 3 \rangle$ is normal to the given plane

thus, $V \times n$:

$$\begin{vmatrix} i & j & k \\ 3 & -2 & -1 \\ 1 & -1 & 3 \end{vmatrix} = -6i - j - 2k + 2k = -6i - j = \langle -6, -1, 0 \rangle$$

$$= \langle -7, -10, -1 \rangle$$

$= \langle -7, -10, -1 \rangle$, this line is normal to the plane we were looking for when $t=0$ on the line:

we get $\langle 0, 1, 1 \rangle$, which also a point on our plane.

Use the point & the normal:

Point $= \langle 0, 1, 1 \rangle$; normal $= \langle -7, -10, -1 \rangle$

thus:

$$= -7x - 10(y-1) - 1(z-1)$$

$$= -7x - 10y + 10 - z + 1$$

$$= -7x - 10y - z + 11$$

$$\therefore -11 = -7x - 10y - z$$

$$\text{or simply, } 11 = 7x + 10y + z$$

thus, the plane we were looking for is: $7x + 10y + z = 11$

b) Identify & describe the quadratic surfaces, a sketch isn't necessary:

a) $z^2 = 4x^2 - 3x + y^2 - 2z + 24$

thus:

$$-24 = 4x^2 - 3x + y^2 - z^2 - 2z$$

$$24 = -4x^2 + 3x - y^2 + z^2 + 2z$$

$$24 = -\left(2x - \frac{3}{4}\right)^2 + \frac{9}{16} - y^2 + (z+1)^2 - 1$$

$$\frac{391}{16} = -\left(2x - \frac{3}{4}\right)^2 - y^2 + (z+1)^2$$

OR: $\frac{391}{16} = -4\left(x - \frac{3}{8}\right)^2 - y^2 + (z+1)^2$

thus:

$$1 = \frac{-64\left(x - \frac{3}{8}\right)^2}{391} - \frac{16y^2}{391} + \frac{16(z+1)^2}{391}$$

this is of the form:

$$1 = \frac{z^2}{c^2} - \frac{x^2}{a^2} - \frac{y^2}{b^2} \quad \therefore \text{This is a hyperboloid of two sheets}$$

the Centre of the Sheets is: $\left(\frac{3}{8}, 0, -1\right)$

↳ We know this from the values which modify the x, y, z
(i.e. $x - \frac{3}{8} \therefore x = \frac{3}{8}$ at the centre)

the top of the Sheet pointing down the z -axis is:

$$\frac{391}{16} = (z+1)^2 \rightarrow z+1 = \pm \frac{\sqrt{391}}{4} \rightarrow z = \frac{-4 - \sqrt{391}}{4}$$

likewise, the bottom of the Sheet pointing up the z -axis is:

$$z = \frac{-4 + \sqrt{391}}{4}$$

thus, taking the Centre into account: (we must make $x = \frac{3}{8}$ & $y = 0$ for $z = \frac{391}{16}$)

the top Sheet's local min. is:

$$\left(\frac{3}{8}, 0, \frac{-4 - \sqrt{391}}{4}\right)$$

the bottom Sheet's local max. is:

$$\left(\frac{3}{8}, 0, \frac{-4 + \sqrt{391}}{4}\right)$$

$$\begin{aligned}
 b) \quad y &= 2x^2 - 6x - z^2 + 5y \\
 0 &= 2(x^2 - 3x) + 4y - z^2 \\
 0 &= 2(x - \frac{3}{2})^2 - \frac{9}{2} + 4y - z^2 \\
 \frac{9}{2} &= 2(x - \frac{3}{2})^2 + 4y - z^2 \\
 9 &= 4(x - \frac{3}{2})^2 + 8y - 2z^2
 \end{aligned}$$

$$1 = \frac{4(x - \frac{3}{2})^2}{9} + \frac{8y}{9} - \frac{2z^2}{9}$$

this is of the form:

$$1 = z - \frac{x^2}{a^2} - \frac{y^2}{b^2} \text{ as there is one linear term (y above), w/ two quadratic terms (x & z above) w/ opposite signs.}$$

\therefore Hyperbolic Paraboloid

the Graph:

- The Paraboloid opens along the y-axis, in the negative direction
- The local Min. of the Paraboloid (the crest of the opening) is:

$$0 = 2(x^2 - 3x) + 4y - z^2 \text{ when } z=0 \text{ \& } x=\frac{3}{2}$$

$$0 = -4.5 + 4y$$

$$4.5 = 4y$$

$$y = \frac{9}{8}$$

thus: the local Min. at the Positive y-axis is $(\frac{3}{2}, \frac{9}{8}, 0)$

- The Graph forms a Parabolic "void" along the Positive y-axis
- The Graph Grows along the z & x-axis forever, but always opens along the neg. y-axis & has a gap between the Pos. y-axis.

11)

a) Give the equation of an elliptic Cone w/ centre at point $(1, -2, 1)$, in the direction of the x-axis in rectangular & cylindrical coordinates:

- An elliptic Cone is of the form:

$$z^2 - \frac{x^2}{a^2} - \frac{y^2}{b^2} = 0 \quad \xrightarrow[\text{direction}]{\text{x-axis}} \quad x^2 - \frac{z^2}{b^2} - \frac{y^2}{a^2} = 0$$

- Thus, if the Centre is at $P(1, -2, 1)$:

$$(X-1)^2 - \frac{(Y+2)^2}{a^2} - \frac{(Z-1)^2}{b^2} = 0 \quad \text{is the equation in Rect. Coord.}$$

- If we let $b=a=1$ then we get a Simple equation:

$$(X-1)^2 - (Y+2)^2 - (Z-1)^2 = 0$$

- In General terms, the equation:

$$0 = \frac{(X-1)^2}{a^2} - \frac{(Y+2)^2}{b^2} - \frac{(Z-1)^2}{c^2} \quad |$$

will satisfy the question (for rectangular Coordinates)

- to Convert to Cylindrical Coordinates:

Let $X = r \cos \theta$, $Y = r \sin \theta$, $Z = z$; then:

$$(r \cos \theta - 1)^2 - (r \sin \theta + 2)^2 - (z - 1)^2 = 0$$

- In General terms, the equation:

$$\frac{(r \cos \theta - 1)^2}{a^2} - \frac{(r \sin \theta + 2)^2}{b^2} - \frac{(z - 1)^2}{c^2} = 0$$

b) Give the equation of an elliptic Paraboloid with Centre at the point $(0, 2, 1)$ in the direction of the y-axis in rectangular and Spherical Coordinates:

- An elliptic Paraboloid is of the form:

$$z - \frac{x^2}{a^2} - \frac{y^2}{b^2} = 0 \quad \xrightarrow[\text{of the y-axis}]{\text{in the direction}} \quad y - \frac{x^2}{a^2} - \frac{z^2}{b^2} = 0$$

- Thus, if the Centre is at Point $(0, 2, 1)$:

$$(Y-2) - \frac{X^2}{a^2} - \frac{(Z-1)^2}{b^2} = 0 \quad [(Y-2) - X^2 - (Z-1)^2 = 0 \text{ When } b=a=1]$$

- To Convert to Spherical Coordinates:

Let $X = \rho \sin \phi \cos \theta$, $Y = \rho \sin \phi \sin \theta$, $Z = \rho \cos \phi$; then:

$$\rho \sin \phi \sin \theta - 2 - (\rho \sin \phi \cos \theta)^2 - (\rho \cos \phi - 1)^2 = 0$$

$$0 = \rho \sin \phi \sin \theta - (\rho \sin \phi \cos \theta)^2 - (\rho \cos \phi - 1)^2 - 2$$

- In General terms, the equation:

$$0 = \rho \sin \phi \sin \theta - \frac{(\rho \sin \phi \cos \theta)^2}{a^2} - \frac{(\rho \cos \phi - 1)^2}{b^2}$$

c) Give the equation of a hyperboloid of one sheet with center $(0,0,4)$ in the direction of the z -axis in Cylindrical & Spherical Coordinates:

- A hyperboloid of one sheet has the general form in Cylindrical Coordinates:

$$z^2 = r^2 - 1 \quad [\text{this is already in the direction of the } z\text{-axis}]$$

- Thus, if we let the centre be $P(0,0,4)$:

$$(z-4)^2 - r^2 + 1 = 0 \quad [\text{when } a=b=c=1]$$

- In General terms, the equation:

$$\frac{(z-4)^2}{d^2} - \frac{r^2}{e^2} + 1 = 0, \text{ when } d, e \in \mathbb{R}$$

- To Convert to Spherical Coordinates:

Let $r = \rho \sin \phi$, $\theta = \theta$, $z = \rho \cos \phi$; then:

$$(\rho \cos \phi - 4)^2 - (\rho \sin \phi)^2 + 1 = 0$$

- In General terms, the equation:

$$\frac{(\rho \cos \phi - 4)^2}{d^2} - \frac{(\rho \sin \phi)^2}{e^2} + 1 = 0, \text{ when } d, e \in \mathbb{R}$$
